In 1877 a series of experiments was conducted by MM. Couty and Charpentier, under the direction of M. Vulpian, in the hope of obtaining a more exact determination of these disturbances. They used curarized dogs with artificial respiration and recorded the results on a kymograph in the usual manner by means of a mercury manometer in connection with an artery. On stimulating the various organs of special sense they obtained cardio-vascular reactions similar in many respects to those usually obtained by stimulating sensory nerves, but differing markedly from these in their greater variability in both form and intensity under the same stimuli. Both pneumogastric nerves were then severed. Sensory stimulation continued to produce its usual effect on arterial tension, but ceased to produce any effect on the heart. This convinced them of the fact that the heart disturbances and vasomotor changes were mediated by distinct mechanisms. The cerebral cortex of fresh subjects was then shut out by pressure, by injection, and by light doses of chloral hydrate.
